LASSO回归

在线性回归损失函数的基础上,增加了对权重的限制,作为正则化项

将有限的权重。放到更重要的特征维度上

$$L_{linear} = \sum_{i=1}^{N} (y_i - \hat{y}_i)^2$$

线性回归

$$L_{\text{ridge}} = \sum_{i=1}^{N} (y_i - \hat{y}_i)^2 + \lambda \|\mathbf{w}\|_2$$

$$\|\mathbf{w}\|_2 = \sum_{i=1}^D w_i^2 = \mathbf{w}^\mathsf{T} \mathbf{w} \qquad \mathbf{k} \mathbf{0} \mathbf{1} \mathbf{3}$$

$$L_{lasso} = \sum_{i=1}^{N} (y_i - \hat{y}_i)^2 + \lambda \|\mathbf{w}\|_1$$
 $\|\mathbf{w}\|_1 = \sum_{i=1}^{D} |w_i|$ LASSO回归

$$\left\|\mathbf{w}\right\|_1 = \sum_{i=1}^{D} \left|w_i\right|$$

正则化项的作用:

使每个权重都不会过大 若 某个权重讨大,则 自变量x一旦发生微小的改变 就会导致输出发生巨大改变 增大了过拟合的危险

牺牲了精度 提高了稳定性

比较岭回归. LASSO回归 可以使学习得到的权重 更加稀疏(集中),不重要的 系数可以为0

$$L_{\text{lasso}} = \sum_{i=1}^{N} (y_i - \hat{y}_i)^2 + \lambda \|\mathbf{w}\|_1$$

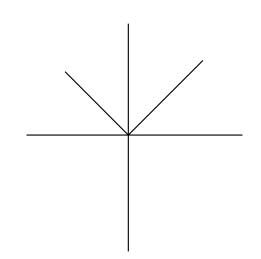

求解方法: 坐标下降法

依次对 w_i 进行寻优,使梯度趋于0,寻优的过程中只对 w_i 进行更改,其他的 w_i 不变

不断迭代,直到每个 w_i 都不产生显著变化为止寻优方法 \mathbf{x} 用梯度下降搜索法

不满足处处可导, 因此

$$\frac{\partial L_{lasso}}{\partial \mathbf{w}} = 0$$
 无法直接求导 没有闭式解

$$L_{lasso} = \frac{1}{N} \sum_{i=1}^{N} (y_i - \hat{y}_i)^2 + \lambda \|\mathbf{w}\|_1 = \frac{1}{N} \sum_{i=1}^{N} \left(y_i - \sum_{j=1}^{D} x_{ij} w_j \right)^2 + \lambda \sum_{j=1}^{D} |w_j|$$

$$= \frac{1}{N} \sum_{i=1}^{N} \left(y_i^2 - 2y_i \sum_{j=1}^{D} x_{ij} w_j + \left(\sum_{j=1}^{D} x_{ij} w_j \right)^2 \right) + \lambda \sum_{j=1}^{D} |w_j|$$

梯度下降公式

$$w_{j} = w_{j} - lr * \frac{\partial L_{lasso}}{\partial w_{j}}$$

$$= w_{j} - lr * \left(\frac{1}{N} \mathbf{x}_{j}^{T} * (\hat{\mathbf{y}} - \mathbf{y}) + \lambda \operatorname{sign}(w_{j})\right)$$

$$\frac{\partial \mathcal{L}_{lasso}}{\partial w_{j}} = \frac{1}{N} \sum_{i=1}^{N} \left(-2y_{i}x_{ij} + 2x_{ij} \left(\sum_{j=1}^{D} x_{ij} w_{j} \right) \right) + \lambda \operatorname{sign}(w_{j})$$

$$= \frac{1}{N} \sum_{i=1}^{N} \left(2x_{ij} \left(\sum_{j=1}^{D} x_{ij} w_{j} - y_{i} \right) \right) + \lambda \operatorname{sign}(w_{j}) = \frac{1}{N} \sum_{i=1}^{N} \left(2x_{ij} \left(\hat{y}_{i} - y_{i} \right) \right) + \lambda \operatorname{sign}(w_{j})$$

$$= \frac{2}{N} \mathbf{x}_{j}^{T} * (\hat{\mathbf{y}} - \mathbf{y}) + \lambda \operatorname{sign}(w_{j})$$

其中: x_i 表示训练数据X的第j列

```
w_{j} = w_{j} - lr * \frac{\partial L_{lasso}}{\partial w_{j}}
= w_{j} - lr * \left(\frac{1}{N} \mathbf{x}_{j}^{T} * (\hat{\mathbf{y}} - \mathbf{y}) + \lambda \operatorname{sign}(w_{j})\right)
```

```
# 坐标轴下降法
